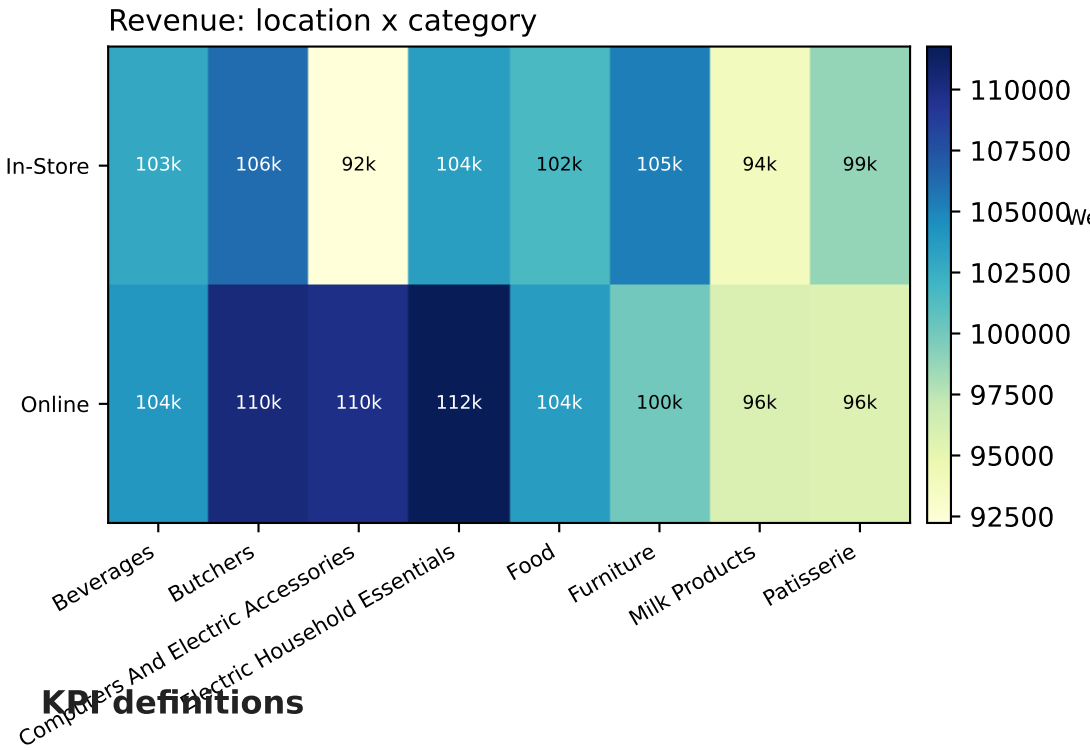
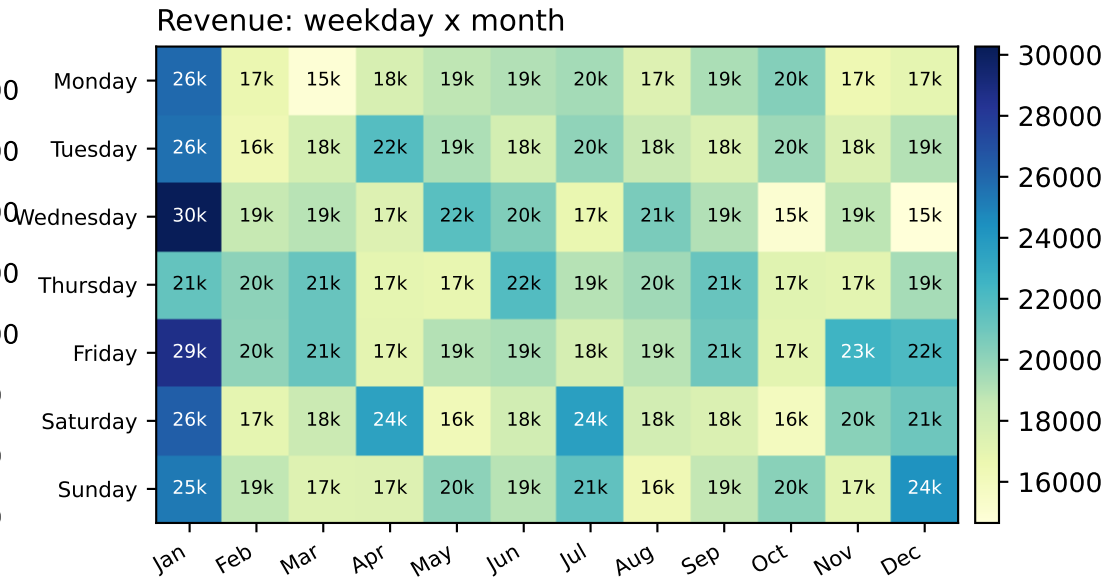
Heatmaps and KPI definitions





KPI definitions

Revenue = sum of total_spent (price x quantity) over the transactions shown.

Average order value = revenue / number of transactions.

Churn rate = customers with no purchase in the 30 days before 2025-01-18 / customers seen in the period.

CAC = assumed marketing spend (10% of revenue in the selected dates) / customers whose first purchase is in the selected dates.

The data has no marketing cost and no geographic fields, so CAC uses an assumption and the location heatmap compares channels.

Revenue changes are compared with the previous period of the same length.
